

Project 2. Spatial Exploration of Tweets

Haoruo Fu

Outline

1. Data Preparation
2. Spatial object I/O and conversion
3. Spatial object's attribute manipulation
4. Mapping overall tweets distribution
5. Mapping area of interest

1.1 Data Preparation

```
#1.1
#read the given xls file csv
pu2014 <- read.csv('Twitter Data File_pu2014.csv', header = TRUE)

#create 'sp'(SpatialPointsDataFrame)
coords_sp <- cbind(pu2014$longitude, pu2014$latitude) #assign the coord
latlon_sp <- CRS("+proj=longlat +datum=WGS84") # Using WGS84 datum
sp <- SpatialPointsDataFrame(coords_sp, pu2014, proj4string = latlon_sp)

#create 'sf' (simple features object)
sf <- st_as_sf(pu2014, coords = c('longitude', 'latitude'), crs = 4326)
```

```
#creat the bounding box
# Find the minimum and maximum latitude and longitude coordinates of tweets
xmin <- min(pu2014$longitude)
ymin <- min(pu2014$latitude)
xmax <- max(pu2014$longitude)
ymax <- max(pu2014$latitude)

#made a bit extra space for the coordinates, 0.1 for latitude and longitude
extra_latlong <- 0.1

#expand the latitude and longitude for 'sp' object
#calculate new bounding box coordinates
new_xmin_sp <- xmin - extra_latlong
new_ymin_sp <- ymin - extra_latlong
new_xmax_sp <- xmax + extra_latlong
new_ymax_sp <- ymax + extra_latlong

#set the expanded bounding box for 'sp' object
new_bbox_sp <- matrix(c(new_xmin_sp, new_ymin_sp, new_xmax_sp, new_ymax_sp), nrow = 2, ncol = 2)
attr(sp, "bbox") <- new_bbox_sp

#expand the latitude and longitude for 'sf' object
#calculate new bounding box coordinates
new_xmin_sf <- xmin - extra_latlong
new_ymin_sf <- ymin - extra_latlong
new_xmax_sf <- xmax + extra_latlong
new_ymax_sf <- ymax + extra_latlong
```

```
#set the expanded bounding box for 'sf' object
new_sf_bb <- c('xmin' = new_xmin_sf, 'ymin' = new_ymin_sf, 'xmax' = new_xmax_sf, 'ymax' = new_ymax_sf)
attr(new_sf_bb, "class") <- "bbox"
attr(sf, "bbox") <- new_sf_bb
```

1.2 Spatial object I/O and conversion

```
#read the shapefiles back from working folder
sf_read <- st_read("sf_shapefile.shp")
sp_read <- readOGR(dsn = ".", layer = "sp_shapefile")

#convert to geojson file
st_write(sf_read, "sf_geojson.geojson") #sf file to geojson
writeOGR(obj = sp_read, dsn = ".", layer = "sp_geojson", driver = "GeoJSON") #sp files to geojson

#create 'sf' or 'sp' object from read-in data if needed
sf_from_geojson <- st_read("sf_geojson.geojson")
sp_from_geojson <- readOGR(dsn = ".", layer = "sp_geojson")

#create KML file
st_write(sf_read, "sf_kml.kml", driver = "KML")
writeOGR(obj = sp_read, dsn = ".", layer = "sp_kml", driver = "KML")

#create object sf or sp same as above
sp_from_kml <- readOGR(dsn = ".", layer = "sp_kml")
sf_from_kml <- st_read("sf_kml.kml")

#create GeoPackage file
st_write(sf_read, "sf_geopackage.gpkg", driver = "GPKG")
writeOGR(obj = sp_read, dsn = ".", layer = "sp_geopackage", driver = "GPKG")

#create object sf sp same
sp_from_geopackage <- readOGR(dsn = ".", layer = "sp_geopackage")
sf_from_geopackage <- st_read("sf_geopackage.gpkg")
```

1.3 Spatial object's attribute manipulation

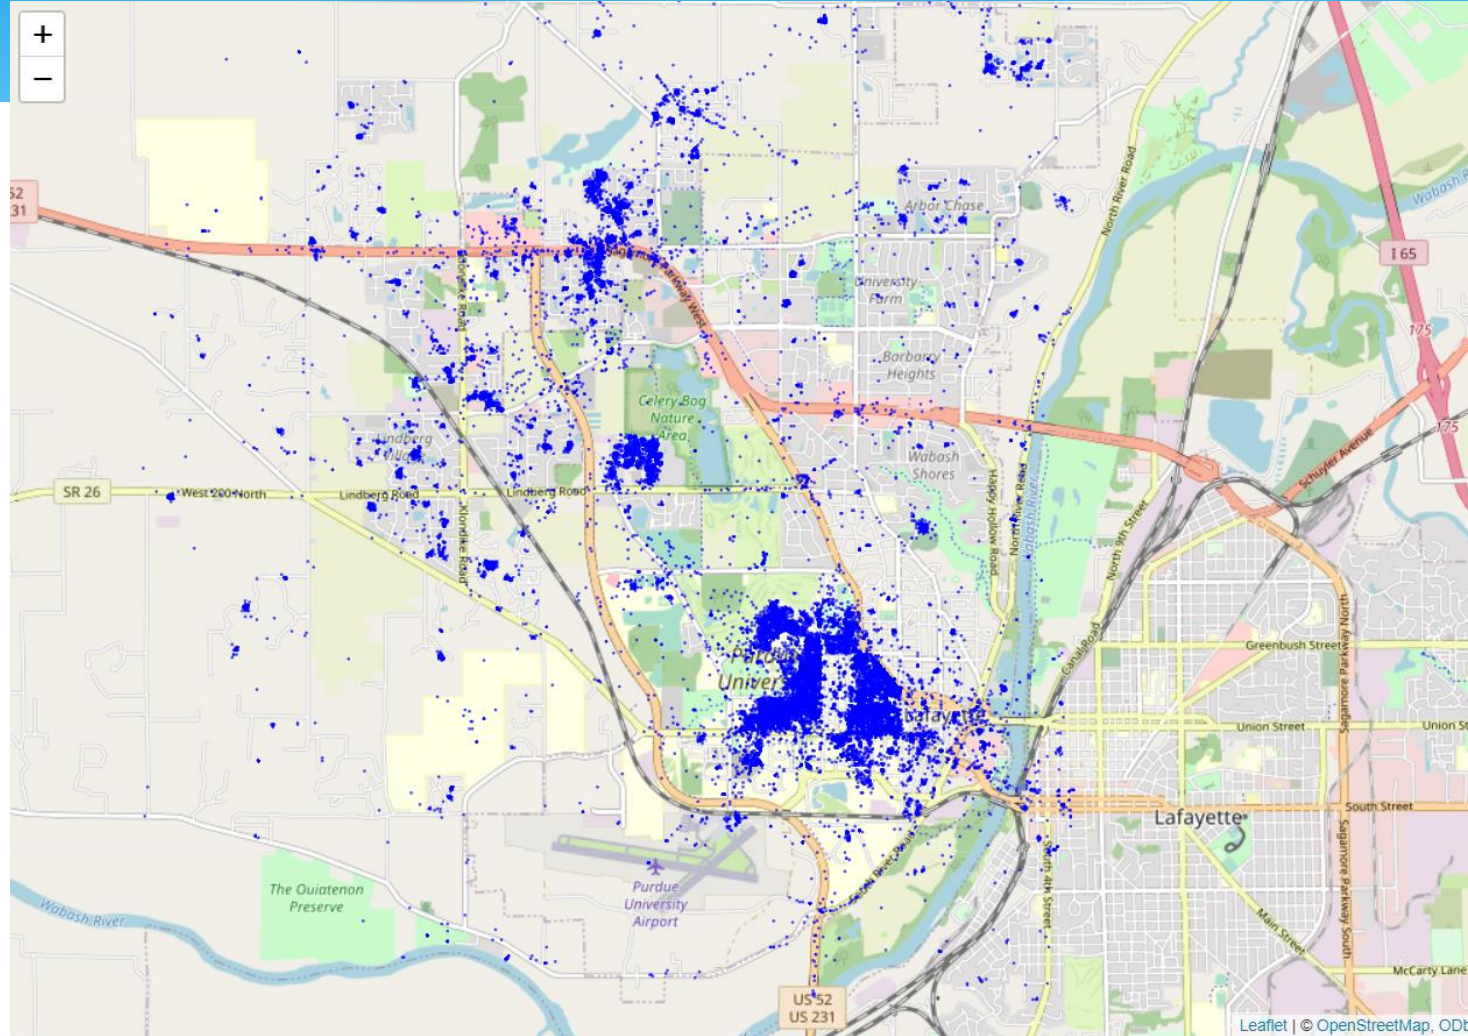

```
#convert 'epoch' column to datetime format
# 1.3 (continued)
sf$datetime <- as.POSIXct(sf$epoch, origin = "1970-01-01", tz = "EST")

#day, month, year
sf$date <- format(sf$datetime, format='%d-%m-%Y')

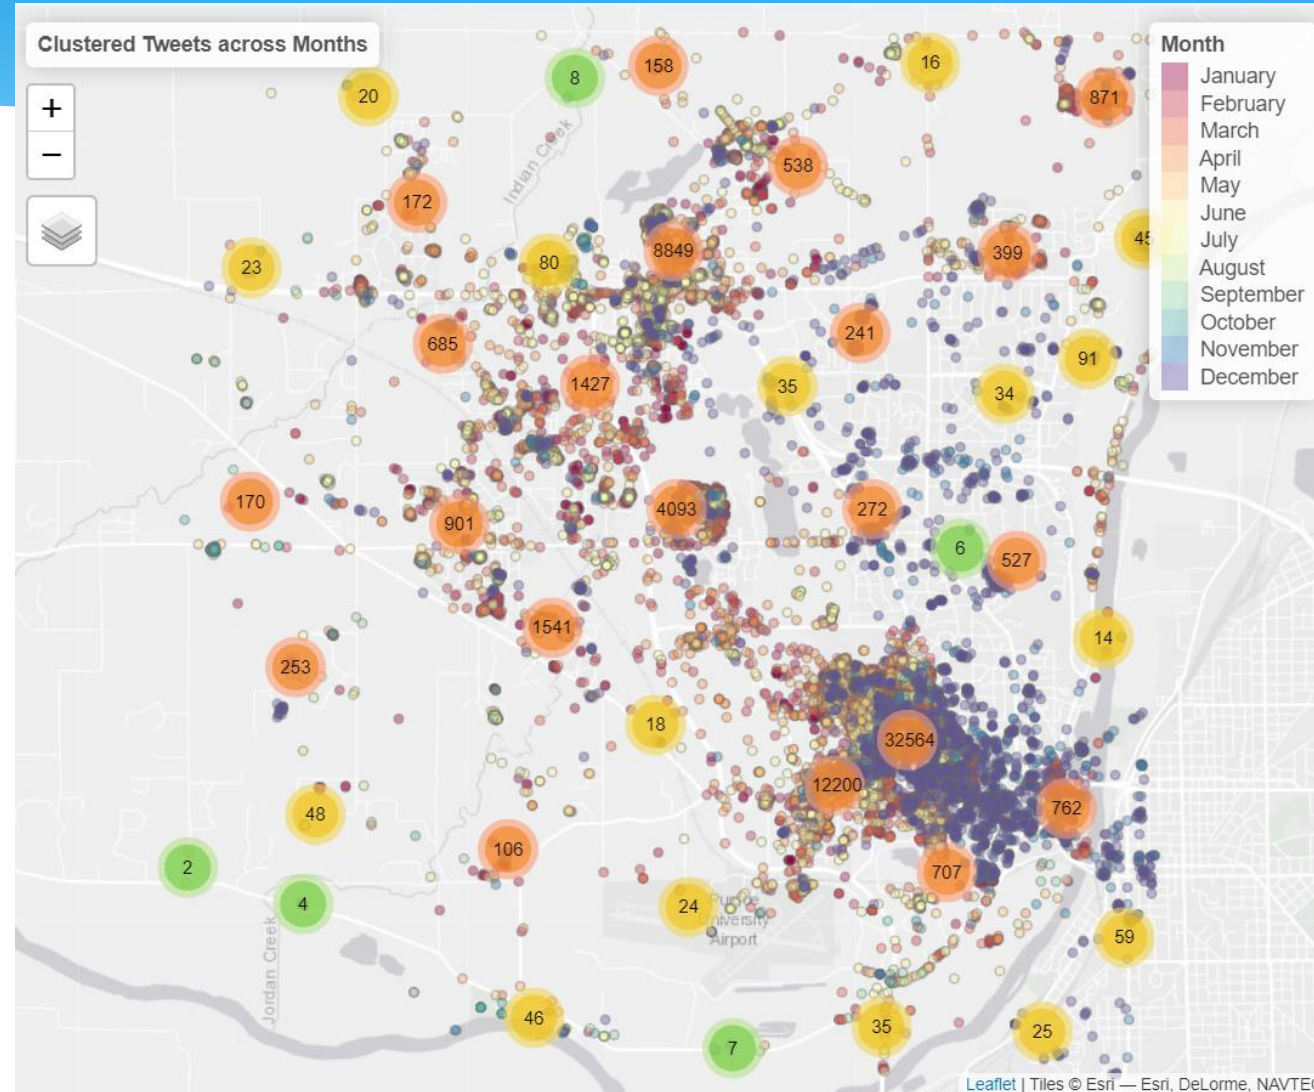

#day of the week
sf$dayofweek <- format(sf$datetime, "%w")
|
#subset
sf_subset <- sf[,c('user_id', 'geometry', 'epoch', 'datetime', 'date', 'dayofweek')]
```

| | user_id | geometry | epoch | datetime | date | dayofweek |
|---|-----------|----------------------------|------------|---------------------|------------|-----------|
